

Project Worksheet

1. Business Requirements Document (BRD)

Project Scope
Analyze and improve hospital operations by addressing delays in patient management, outdated record-keeping systems, and communication inefficiencies between departments. The project includes admissions, patient records, interdepartmental communication, and technology improvements.

Stakeholders
1. Hospital Administration 2. Doctors 3. Nurses 4. IT Department 5. Patients

Business Objectives
The objectives of this project are to reduce patient wait times and improve operational efficiency, improve communication and coordination between hospital departments, streamline patient record management through digital systems, and enhance patient care and overall service quality.

Functional Requirements
BR-01: Implement a centralized electronic medical records (EMR) system for managing patient data. BR-02: Implement an automated patient registration and admission system. BR-03: Enable real-time communication between hospital departments. BR-04: Provide secure access to patient records for authorized staff.

Non-functional Requirements
1. The system should respond within 2 seconds. 2. Patient data should be secure and accessible only to authorized personnel. 3. The system should be available 24/7 with minimal downtime. 4. The system should be scalable to support future growth.

Assumptions - Existing patient data can be migrated to the new system.

Constraints - Healthcare regulations and data privacy requirements must be followed.

2. Scenario: Digital Transformation in Healthcare

Stakeholder	Role	Interest	Influence	Involvement
Hospital Admin	Oversees hospital operations and decision-making	Improve efficiency, reduce costs, improve patient care	High	High
Doctors	Provide medical treatment and patient care	Faster access to patient records and better communication	High	Medium
Nurses	Support patient care and maintain records	Reduce paperwork and improve workflow	Medium	Medium
IT Department	Manage hospital technology and systems	Successful implementation of new digital systems	High	High
Patients	Receive healthcare services	Reduced wait times, better service quality, accurate records	Medium	Low

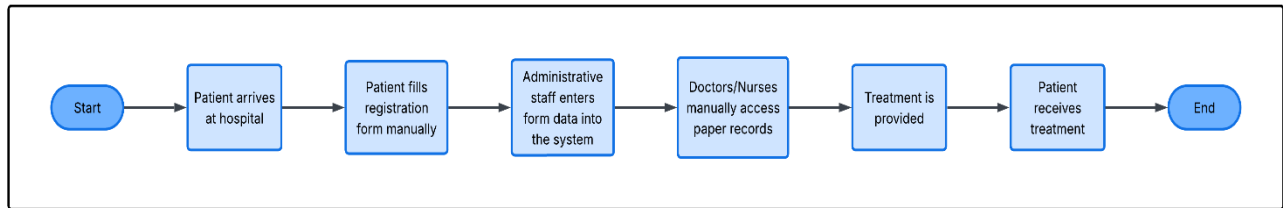

3. Gap Analysis Table

Current State	Desired Future State	Gaps Identified	Proposed Solutions
Patient records are maintained manually using paper-based systems.	Patient records are stored and managed electronically.	Outdated record-keeping system.	Implement an Electronic Medical Records (EMR) system.
Patient admission and registration processes are slow and manual.	Fast and automated patient admission process.	Delays in patient management.	Introduce an automated patient registration and admission system.
Communication between departments is slow and inefficient.	Real-time communication between departments.	Lack of integrated communication tools.	Implement a centralized communication platform.
Accessing patient information takes time and may cause errors.	Quick and accurate access to patient information.	Inefficient data retrieval process.	Create a centralized digital database for patient records.

4. Process Flow Diagrams – Created in LUCIDCHARTS

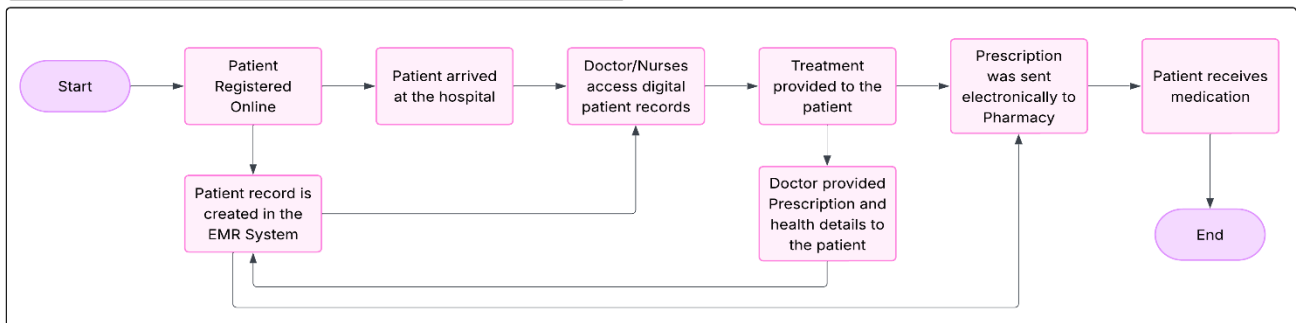

Current State Process Flow

Hospital Patient Intake and Treatment Process

Future State Process Flow

Hospital Patient Intake and Treatment Process (Future State)

5. Prioritization Matrix

Requirement ID	Title	Impact	Feasibility	Priority
BR-01	Centralized EMR System	High	High	High
BR-02	Automated Patient Registration	High	High	High
BR-03	Real-time Communication System	Medium	Medium	Medium
BR-04	Secure Access to Patient Records	High	Medium	High

6. Technology Assessment Document

Current technology: Paper-based patient records, manual registration processes, and traditional communication methods between departments.
Proposed technology: Electronic Medical Records (EMR) system, automated patient registration system, centralized digital database, and real-time communication platform.
Justification for changes: The proposed technologies will reduce paperwork, improve data accuracy, speed up patient registration, enhance communication between departments, provide quick access to patient records, and improve overall hospital efficiency and patient care.

7. Change Management Plan [Optional]

Training Plan: Provide training sessions for hospital staff on the new digital systems.
Communication Plan: Inform all stakeholders about the changes and project benefits through meetings and emails.
Resistance management: Gather feedback from staff and address concerns during implementation.

8. Solution Evaluation Metrics [Optional]

Metric	Baseline	Target	Current performance
Patient Registration Time	20 Minutes	5 Minutes	20 Minutes
Record Retrieval Time	10 Minutes	2 Minutes	10 Minutes
Interdepartmental Communication Delay	30 Minutes	5 Minutes	30 Minutes

Conclusion

The Digital Transformation in Healthcare project aims to improve hospital operations by replacing manual processes with digital solutions. The proposed system will enhance patient record management, reduce registration delays, improve communication between departments, and provide faster access to information. By implementing technologies such as Electronic Medical Records (EMR) and automated registration systems, the hospital can increase efficiency, improve service quality, and deliver better patient care.
